## Dream 45

Where price meets time change is inevitable. One of the effective and simple way to understand price time balance is the diagonal angle of a square i.e.  $45^\circ$  angle or in price /time terms we call it 1x1 angle since it depicts 1 unit of price to 1 unit of time. We use mitotic scaling of charts hence understanding  $45^\circ$  will be a little complicated since the ratio of Y-axis with that of X-axis is set as per mitotic scaling rules.

Let us not go into those calculations since we already have mitotically scaled charts ready with us in Fortune Plus software. Normally, we apply  $45^\circ$  angle on important lows in the upward direction and important high for downward direction, to know the point in future when scrip comes back to that angle and make an important change in direction. Most of the time we lose track of that specific scrip where we have applied angle and when we check that scrip we find that it has already moved exactly from  $45^\circ$

We are finally successful in tracking of scrip which come on  $45^\circ$  angle, thus giving all of us an edge over others in getting high speed trending scrip. This project is like dream come true hence we named it as **Dream-45 project**. This tool has the power of fulfilling your dream of MINTING money in the stock market.

Normally, we apply  $45^\circ$  angle on important low/high for upward/downward direction. It has been observed that over a period of time scrip again comes back to that angle, take its support/ resistance and make an important change in direction. We can apply 1x1 angle to absolute lows/highs or we can have our own methods of application, like zero bouncing, low bouncing and many more. Let us make it simple for understanding purpose. Here we will talk of plain and simple 1x1 which we are applying at important locations, lows/highs. Higher time frame rules lower time frame. Same holds true with Dream45. (In dream 45, we can apply 1x1 angles on monthly / weekly /daily time frames, higher the time frame better will be the results.)

Let us understand the functionality, how to actually use this project. In Dream 45, basically we have icons named (U), (D) and (45).

**A)** Icon (U) is used for application of Up-45° angle.

**B)** Icon (D) is used for application of Dn-45° angle.

**C)** Icon (45) is a scanner to know which scrip will be on fire.

Here we will take example of M&M Ltd to understand the concept.

Fig 14.1 –M & M Ltd

As shown in the fig 14.1, for applying dream45 angle you need to click on green the colour icon (U), next click on any important low. Once you click on point A, which is important low, you will be asked for registering this scrip as favorite. Once you accept, above scrip will be tracked and whenever it comes close to 1x1 angle it will be shown in scanner to you. Every angle you plot comes with unique stamp with it, so that you can relate the information marked with it. In above fig you can see the Stamp **M&M (TD # UP) -356** which indicates Name of scrip, Time frame ( TD-trading day/CD-calendar day /WK-weekly/MO-monthly).

UP –means up 45° angle & DN –means down 45° angle. The Next field is number, since we might apply multiple angles on multiple scrips and on multiple time frames, we have a dedicated number for every angle. We can identify by a number which specific angle we are considering , and on which 45° angle, the scrip is coming close. So the stamp keeps the unique identity of that angle.

Now once you apply angles rest of the work is done by Dream 45 scanner. It will tabulate all data in ready format & inform which scrip you need to focus on. Check the following screenshot to know how to interpret.

Fig 14.2 –Dream 45 scanner

To open up the scanner you need to click on (45) icon available on the toolbar. Next to activate calculations, you need to click on Generate icon. You can choose specific scrip or all scrip in the next column. Next you can specify the percentage difference from 1x1 angle to reduce the displayed scrip. Finally, click on the Display icon of scanner to view list. In the above screenshot I have given numbers to columns of Dream 45 scanner. Let us understand the importance one by one.

- 1) Chart - Once you populate the list, you have long list of scrips. To open up a specific chart you need to click on the chart column which is before the scrip name.
- 2) Scrip - Scrip name with a unique stamp to identify the details. Details of the stamp already mentioned on the previous page.

- 3) Plot price - It is the rate of scrip where u have applied Dream 45 angle.
- 4) Today's H/L—If we are plotting up 45° angle, this column indicates today's low price & if we are plotting down 45° angle it indicates today's high price.
- 5) Today's 45° - This shows the level of 45° angle, related to today's bar.
- 6) +1D 45 ° - If you are an aggressive trader and want to catch scrip next day at Dream 45 angle this column is icing on the cake. It shows next bars Dream 45 level.
- 7) Diff. - It is the difference in price between today's H/L & to day's 45°.
- 8) % diff - It shows above difference in % terms.
- 9) % diff 2x1 - It shows % difference from 2x1 angle with respect to the initial point where we have applied 45 ° angle.
- 10) % diff 1x2 - It shows % difference from 1x2 angle with respect to the initial point where we have applied 45 ° angle.
- 11) Days - It is difference of time between angle insertion point and today's or current time frame.
- 12) Del - by clicking on delete you can delete data entry that is not relevant.

We have a sorting option available on all columns. You can sort scrips in alphabetical ascending or descending order. Similarly on the numerical columns, you can sort in high to low or vice versa. So to get scrips which are close to dream 45 angle, you can click on % diff column heading.

We have % diff 2x1 & % diff 1x2 columns. When we apply dream 45 up or dn angles, only 45 ° angles are displayed on screen, but at the backend calculation are done for both 2x1 as well as 1x2 angles. Angles are not shown just to keep the chart clean. Whenever we find any scrip coming close to 2x1 or 1x2, we can manually recheck by applying specific angles from Angles section in toolbar 2 at the top.

Dream 45 scanner has next & previous buttons at the bottom. You can view next or previous chart with the help of above buttons. We also have option to save the list in .xls format for future reference. Lets check examples to understand the effectiveness of Dream-45 project.

Below we have chart of Gland Pharma ltd. On first day of trade it has marked low of Rs 1700/-. We marked Up 45° angle from that low marked as point A, which is seen in green colour. Now whenever scrip comes close to 45° angle we can see that % difference between low of that day and 45° angle reduces, thus indicating a potential trade. In below mentioned chart Point B,C, & D are all potential trading opportunity.

Fig 14.3 –Gland pharma -Dream

In below shown chart of Castrol India, we applied Dream45 at bottom. When scrip went below 45° and touched 1x2 we got alert in % diff 1x2 column, thus getting potential trade.

Fig 14.4 –Castrol India -Dream 1x2

Lets check chart of Anglo, traded on Johannesburg stock exchange. Anglo marked a low of 204 Rand ( south African currency) on 19th march 2020. We applied Dream45 up angle from the bottom of this day. On 30th October 2020 scrip came very close to 45° and it was shown on Dream 45 scanner. The rate of Anglo made a low of 370 rand near 45° angle. Here price balanced with time and rally started, within 90 days price marked a high of 640 rand on 9th march 2021.

Fig 14.5 –Anglo –JSE chart

Also check following chart of SBI card traded on NSE. Rallied from Rs 800 to Rs 1139 in 50 days after touching Dream 45 level.

Fig 14.6 –SBI cards
