Astronomical Geometry - a new concept

Now let us go to altogether different dimension of thinking regarding price and time in the market. There is great relationship between the influence of the celestial bodies on human kind, since we are inscribed in the system and part of it. In fact we are product of the overall celestial dance, hence the effect of Macro cannot be denied on Micro. One such event which we see daily on our earth is high tide and low tide which is the effect of very small celestial body as compare to other counterparts in our solar system. A huge amount of water is displaced on earth by a baby celestial body, we can imagine the effect of larger celestial bodies have on our ecological system.

Today human race is quiet advanced to know the locations of the planets precisely many years in advance. We can calculate many celestial events in advance and thus the effects of those events on our lives. We are aware of the chemical compositions of the planets, we are aware of the distances and sizes of the planets, thus we know the geometrical structure of the locations of these celestial bodies with respect to each other.

Coming back to square one, here we are concerned more on the effect of these celestial bodies on our portfolio.

Let me present you a white paper on this. Wherein I have considered mother earth, moon and Sun and the specific geometry they share with each other. We should know the basic facts regarding these three celestial bodies. Let me brief you in short,

Facts

one moon rotation around earth - 27.3 days

size of moon to earth - apx 27%

Additional facts

Diameter of sun is 108 times diameter of earth.

Distance of sun to earth 108 times diameter of sun.

Average distance of moon from earth 108 times diameter of moon.

Method

Take any major important swing on calendar day chart with mitotic scaling. Draw a circle inscribing the swing. Here we take example of nifty chart. We have taken low of 27th Oct 2008 as center of the circle and drawn a circle taking into consideration radius as high of 5th Nov 2008.

Fig 9.1 – Nifty 50 calendar day chart

Remember again that the chart is Mitotic scaled chart available in Fortune Plus software, results will not be up to mark if any other scaled chart is used.

Here you get radius = 62.3901 units, we are considering this circle as mother earth. We can calculate circumference as well as area by standard formula

circumference	=	392.009 units ($C = 2\pi r$)
area	=	12228.7 units ($A = \pi \times r^2$)
diameter	=	124.7802 units

Now we take 27.26% of diameter 124.7802 = 34.015
Hence the circumference will be = 106.86

Now plot this distance of circumference from the lowest swing point on the same date in trading day chart. To get intermediate turning points take factors of 106.86 like 53.43, 26.71, 13.35 etc.
